

Who brings power to my home?

An electrician is someone who brings power to your home.

Electricians can install solar panels on the roof. Solar panels turn sunlight into energy that powers your home.

Flipping a switch either starts or stops the flow of electricity in that room.

Wires of all shapes and sizes connect electrical energy to every outlet, light, and appliance in your home.

An outlet connects a device to a supply of electricity. If your TV is unplugged from an outlet, it won't turn on.

The electrical panel is like a control center that safely directs electricity to different parts of your home.
